

The Flowcine Black arm is a 3-axis suspension system with a vibration mount for stabilizing roll and tilt axes as well as vertical movements and vibrations. The Black Arm is a hardmount system, made for remoteheads, that you can use on vehicles such as cars, ATVs, boats, snowmobiles, etc. With the Flowcine Black Arm it is easy to reduce the effects of shocks, vibrations and bumps during filming with a camera on a vehicle, dolly or other moving platform.

The system provides excellent damping and stability, virtually isolating the camera from vibrations and shocks caused by vehicle or environmental movement.

The Flowcine Black Arm can be easily mounted on a variety of rigs and platforms, and the spring force can be easily adjusted through a single (one spring on each side) or dual (two springs on each side) configuration.

Flowcine Black Arm

Max Payload	34 kg (75lbs)
Head montage	Mitchel
Underslung	Yes
Overslung	No
